PRODUCT BRIEF

ENDURION

ATLAS

Purpose

Endurion Atlas makes approved manuals, knowledge articles and internal procedures searchable. Role, context and document version shape retrieval, with draft answers pointing to the relevant passages.

Workflow

01	**Select source collections**	Choose approved manuals, SOPs and articles with a clear document owner.
02	**Prepare and version**	Structure content, label revisions and add relevant technical metadata.
03	**Retrieve with context**	Find passages relevant to user permissions, equipment and current task.
04	**Answer with evidence**	Display suggestions with source links; escalate uncertain cases to responsible people.

Requirements

Permissions apply at retrieval, not just when displaying an answer. Indexing, changes, deletion and old versions need testable rules. Role changes and unanswerable questions belong in the test set.

Scope limits

Search quality depends on sources, freshness and permissions. A language model can draw incorrect conclusions. Without a reliable passage, the answer must be withheld or referred to a subject owner.

Useful search depends on maintained sources and effective permissions. Both are checked before deployment.

Next step

Describe your initiative and unresolved decisions. Scope, access and implementation are agreed before the project starts.
