PRODUCT BRIEF

ENDURION

LEDGER

Purpose

Endurion Ledger proposes extracted values from invoices, inspection records and job documents. Required fields and inconsistencies are checked before an approved record reaches your target system.

Workflow

01	**Capture and classify**	Defined inboxes or repositories accept approved file formats with recorded origins.
02	**Extract and suggest**	OCR or suitable AI models propose document type, dates, references and line items.
03	**Validate and approve**	Missing fields, duplicates and inconsistencies appear in a traceable review screen.
04	**Controlled delivery**	Approved records can move through an API or documented export into the target system.

Requirements

Document access, processing, retention and target permissions are defined separately. The pilot measures extraction errors, unresolved cases and remaining review time, rather than just the number of processed PDFs.

Scope limits

Poor scans, handwriting and unusual tables can cause recognition errors. Unresolved values are not silently accepted. Payment approval and binding postings require a separately agreed process.

Ledger is configured for your documents and systems. It is not an off-the-shelf application ready to use on this website.

Next step

Describe your initiative and unresolved decisions. Scope, access and implementation are agreed before the project starts.
